

I am a freelance professional who specializes in civil engineering and architectural projects right through from the analysis and planning phase to eventual construction. My philosophy is about achieving maximum quality in architecture with minimal energy consumption, by means of the intelligent use of materials and renewable resources.

**Considering architecture as a tailored practice, it is essential to redefine the relationship between nature and contemporary buildings, between technology, function and aesthetics.**

Buildings are planned with the intention of creating living and working spaces of notable comfort, obtained through a combination of innovative, constructive techniques and the use of high quality materials. Investing in the quality of spaces and especially in services, for example spaces of distribution and support, is not considered a mere luxury but, on the contrary, a way to increase well-being and aesthetic and functional quality.

My commitment lies in obtaining high standards of design with an emphasis on integrated planning. This is made possible by collaborating with a network of specialist consultants from academic, professional and business spheres. It is with such a unique combination of specialized elements that we have been able to create a multidisciplinary structure, organized around the development of all aspects of the “Architecture and Engineering” project from the elaboration of the initial concept to the direct control and overseeing of its completion, working alongside our graphics studio.
